AAE: more about the treatment
9 September 2003

What is Advanced Allergy Elimination (AAE)?

It is a new technology that merges western science with 3000-year-old Chinese acupuncture to create a non-invasive and drug-free treatment. AAE treats the problem at its source by retraining the body's immune system so that it no longer reacts inappropriately to the allergen.

How does it work?

The therapy uses pressure rather than needles to stimulate nerve bundles along the spine corresponding with the major organ systems while the patient is exposed to safe levels of the allergen that their body is overreacting to.

By associating the allergen with a strengthening of the major organs, the body's immune system alters its perception and corrects its own erroneous response. The AAE treatment does not involve the use of medications, herbal remedies or supplements, and no other therapies or products are offered in the clinic.

How many treatments do I need?

This therapy is able to eliminate most allergies with one treatment per allergen family. For instance, if a client has an allergy to dairy products and sugar, the dairy allergy will be eliminated in one treatment and the sugar allergy in the following treatment.

What allergies can AAE treat?

AAE can treat most types of allergies. The causes of the most common allergies include:

- Foods — such as sugar, wheat and grains, dairy, eggs, fruit.
- Airborne irritants — pollens, grasses, dust, moulds, cigarette smoke, cat hair.
- Contactants — perfumes, body care products
- Chemicals — fumes, domestic and commercial cleaners, building materials.
- Medicines.
- Environmental — pollution.
- Climate — thunderstorms, heat, humidity, cold and damp.

What can I expect to happen after the treatment?

Patients can start or resume exposure to the substance that caused the allergic reaction without any negative side-effects.
