Press Release

November 29, 2011

The Burzynski Clinic is issuing the following public statement regarding recent internet activity between U.K. bloggers who have provided inaccurate factual information regarding the Clinic and Marc Stephens.

Marc Stephens was recently hired by the Burzynski Clinic as an independent contractor to provide web optimization services and to attempt to stop the dissemination of false and inaccurate information concerning Dr. Burzynski and the Clinic.

We understand that Marc Stephens sent a google map picture of a blogger’s house to the blogger and made personal comments to bloggers. Dr. Burzynski and the Clinic feel that such actions were not appropriate. Dr. Burzynski and the Burzynski Clinic apologize for these comments. Marc Stephens no longer has a professional relationship with the Burzynski Clinic.

These bloggers will be contacted by attorneys representing the Clinic informing them of the specific factual statements contained in these blogs which the Clinic believes are false and defamatory, including the following:

- A. Antineoplastons are made from urine. *False* - Antineoplastons are synthesized from chemicals.
- B. That Dr. Burzynski falsely claims to have a PhD.- *False* In fact, Dr. Burzynski has a Ph.D. from the Medical Academy of Lublin and a copy of an official affidavit will be put up on the Burzynski Clinic web site (www.cancermed.com).
- C. There are no scientific studies supporting antineoplaston treatment since 2006. *False* - below is a list of publications and abstracts providing the results of the FDA approved clinical trials since 2006 which demonstrate the treatment’s efficacy on a wide variety of brain tumors.

UK bloggers made factual misstatements about the clinic as a response to a funding campaign relating to a UK patient named Laura Hymas who was diagnosed with glioblastoma multiforme, a deadly form of cancer. She commenced treatment at the Clinic in August, 2011. We are happy to report that Laura is doing well on antineoplaston treatment and that her tumor is shrinking. Her personal blog about her treatment by the Burzynski Clinic is at www.hopeforlaura.com

Eleven (11) Phase II FDA approved clinical trials using antineoplastons for various forms of brain tumors have been completed. Based on the positive results, the FDA has granted permission to undertake Phase III clinical trials. The results of these trials are detailed in the Burzynski Research Institute’s SEC (Securities and Exchange Commission) filings available at (http://finance.yahoo.com/q/sec?s=bzyr.ob).
